SERVICE INFORMATION

AIR MASS TOO HIGH OR TOO LOW

FREQUENTLY THIS FAULT IS NOT DUE TO THE AIR MASS SENSOR

Suitable for

all vehicles provided with exhaust gas recirculation and Pierburg air mass sensors

POSSIBLE COMPLAINTS:

- “P0102 air mass too low”
- “P0103 air mass too high”

Whenever such error messages occur, a malfunction in the air mass sensor is often suspected. However, the malfunction can also be in the EGR system, for instance if the EGR valve is stuck either when open or closed.

POTENTIAL FAULT:

a) The EGR valve (03) is permanently open

The amount of returned exhaust gas (07) is much higher than required. As a result, less fresh air (05) arrives at the cylinders. The air mass sensor measures less air than calculated by the engine control unit (06).

b) The EGR valve (03) remains closed

No or only very little exhaust gas is returned (07). As a result, more fresh air (05) arrives at the cylinders. The air mass sensor measures more air than calculated by the engine control unit (06).

REMEDY:

Check EGR valve and replace if necessary.

Principle of Exhaust Gas Recirculation (EGR)

All content including pictures and diagrams is subject to change. For assignment and replacement, refer to the current catalogues or systems based on TecAlliance.
